

PRODUCT DESIGN CASE

piatto

CALORIE CALCULATOR & RECIPE DISCOVERY

A calm, portion-first nutrition product

Product design · Design System · Storybook

Two focused user needs

- 01
- Calculate calories and nutrition for a food, product or dish.
- 02
- Find a suitable recipe based on dietary preferences and constraints.

CALORIE CALCULATOR

Precision without intimidation.

WHY THIS DIRECTION

I first explored a dark, technical direction and dropped it. Nutrition estimates are approximate, so the product should communicate clarity without implying false precision.

Plus Jakarta Sans
Inter Tight

298 kcal

Puy lentils, ready to eat

250 g portion · 119 kcal per 100 g

From visual language to reusable UI

23
reusable components

107
Storybook stories

MacroEnergySplit — the brand arc, working as data.
Hidden entirely when the data is incomplete.

Tokens, not values, and 44 px minimum touch targets throughout.

Loading, empty and error states belong to the component, and unknown data is never drawn as zero.

The product also handles uncertainty

Loading

No results

Offline

Incomplete nutrition

Camera access off

Missing data is explicit. Unknown never becomes zero. Recovery actions stay available.

107 stories audited

0 horizontal overflow

0 touch targets under 44 px

0 automated WCAG 2.1 A/AA violations

0 page errors

Designed with AI, directed by product decisions

I DECIDED

- Two focused user jobs → four core screens
- No onboarding, dashboard or extra product scope
- Rejected the dark technical direction after review
- Selected and approved Piatto, the arc motif and macro colour roles
- Reviewed major design checkpoints before implementation

CLAUDE CODE IMPLEMENTED

- Reusable Design System in Storybook
- 23 components / 107 stories
- 4 core screens / 34 application states
- MacroEnergySplit and Piatto brand integration
- Screenshot capture, presentation tooling and GitHub Pages workflow

I VERIFIED

- Visual hierarchy and UX decisions at every checkpoint
- 0 horizontal overflow at 390 px · 44 px minimum touch targets
- Automated accessibility checks
- Loading / error / missing-data behaviour
- Git diffs before merge, and the final live Storybook

AI accelerated implementation and verification.

Design decisions, scope and review stayed explicit and human-directed.
